Title An Artificial Metalloenzyme for Olefin Metathesis

Journal Journal of the Chemical Society, Chemical Communications

Volume 47

Number 44

Pages / Article-Number 12068-12070

Keywords HEAT-SHOCK-PROTEIN; METHANOCOCCUS-JANNASCHII; CROSS-METATHESIS; CATALYSTS; WATER; SITE

A Grubbs-Hoveyda type olefin metathesis catalyst, equipped with an electrophilic bromoacetamide group, was used to modify a cysteine-containing variant of a small heat shock protein from Methanocaldococcus jannaschii. The resulting artificial metalloenzyme was found to be active under acidic conditions in a benchmark ring closing metathesis reaction.
