**Keywords** pyoderma, microbiological investigation, *Staphylococcus pseudintermedius*, antibiogram, antibiotic treatment

We report the antibiotic treatments administered to a female dog with mastitis and successive pyoderma. Microbiological investigations allowed the identification of *Staphylococcus pseudintermedius* after 54 days of various antibiotic treatments. The isolate carried the *mecA* gene and was resistant to 9 of 15 tested antibiotics. Consistent antibiotic treatment of the infection was possible only after accurate microbiological diagnosis
