Title Artificial metalloenzymes as selective catalysts in aqueous media

Journal Coordination Chemistry Reviews

Volume 252

Number 5-7

Pages / Article-Number 751-766

Keywords asymmetric catalysis, artificial metalloenzymes, hybrid catalysts, designed evolution, redox reactions, hydrolysis, C-C bond formation, DNA-cleavage

The fusion of homogeneous and enzymatic catalysis has recently drawn attention due to reported novel activities and high selectivities. The incorporation of metal-catalysts into proteins combines the advantages of both catalytic strategies. Herein we summarize recent approaches of artificial metalloenzymes applied to catalysis. The discussion includes different strategies of anchoring and screening for improved selectivity.
