Title Test-retest reliability of stride time variability while dual tasking in healthy and demented adults with frontotemporal degeneration

Journal Journal of neuroengineering and rehabilitation : JNER

Volume 8

Number 1

Pages / Article-Number 37

Although test-retest reliability of mean values of spatio-temporal gait parameters has been assessed for reliability while walking alone (i.e., single tasking), little is known about the test-retest reliability of stride time variability (STV) while performing an attention demanding-task (i.e., dual tasking). The objective of this study was to examine immediate test-retest reliability of STV while single and dual tasking in cognitively healthy older individuals (CHI) and in demented patients with frontotemporal degeneration (FTD).
