Title Intravenous thrombolysis in nonagenarians with ischemic stroke

Journal Stroke

Volume 42

Number 7

Pages / Article-Number 1967-70

Keywords outcome, thrombolysis, ischemic stroke, nonagenarian

Demographic changes will result in a rapid increase of patients age ≥90 years (nonagenarians), but little is known about outcomes in these patients after intravenous thrombolysis (IVT) for acute ischemic stroke. We aimed to assess safety and functional outcome in nonagenarians treated with IVT and to compare the outcomes with those of patients age 80 to 89 years (octogenarians).
