Effect of Ginkgo biloba special extract LI 1370 on dual-tasking in patients with MCI: a randomized, double-blind, placebo-controlled exploratory study

Third-party funded project

Project title Effect of Ginkgo biloba special extract LI 1370 on dual-tasking in patients with MCI: a randomized, double-blind, placebo-controlled exploratory study

Principal Investigator(s) [Kressig, Reto W.](#) ;

Organisation / Research unit

Bereich Medizinische Fächer (Klinik) / Geriatrie (Kressig)

Department

Project start 01.07.2009

Probable end 31.12.2014

Status Completed

The aim of this study is to evaluate the effects of Ginkgo Biloba Extract (GBE) in executive function-impaired Mild Cognitive Impairment (MCI) patients by assessing gait while walking alone as well as under differing dual-task conditions. The primary endpoint in the evaluation of GBE efficacy is gait speed. The secondary endpoint is cycle time variability under dual-task conditions.
