Organisation / Research unit

Departement Psychologie / Klinische Psychologie und Psychotherapie (Gaab)

Project start 01.10.2011

Probable end 01.08.2013

Status Completed

The aim of this study is to investigate the effects of context induced short-term state beliefs (e.g. analgesia expectation) and long-term personality traits beliefs (e.g. magical thinking) on the laterality of pain perception in healthy children.

Financed by

University funds
