Innate immunity : pattern recognition in plants

Book Item (Buchkapitel, Lexikonartikel, jur. Kommentierung, Beiträge in Sammelbänden)

ID 1529928

Author(s) Chinchilla, Delphine; Boller, Thomas

Author(s) at UniBasel [Boller, Thomas](#) ; [Chinchilla, Delphine](#) ;

Year 2012

Title Innate immunity : pattern recognition in plants

Editor(s) Martin, Francis; Kamoun, Sophien

Book title Effectors in plant-microbe interactions

Publisher Wiley-Blackwell

Place of publication Chichester

Pages S. 3-32

ISSN/ISBN 978-0-470-95822-3 (hbk.) ; 9781119949107 (ePDF) ; 9781119949138 (Wiley Online Library) ; 9781119949114 (ePub) ; 9781119949121 (Mobi)

For many years, research on a suite of plant defense responses that begin when plants are exposed to general microbial elicitors was underappreciated, for a good reason: There has been no critical experimental demonstration of their importance in mediating plant resistance during pathogen infection. Today, these microbial elicitors are named pathogen-or microbe-associated molecular patterns (PAMPs or MAMPs) and the plant responses are known as PAMP-triggered immunity (PTI). Recent studies provide an elegant explanation for the difficulty of demonstrating the role of PTI in plant disease resistance. It turns out that the important contribution of PTI to disease resistance is masked by pathogen virulence effectors that have evolved to suppress it.
