Keywords Meson photoproduction, Strangeness, Cross section, Meson-baryon interaction, Dynamically generated resonance

The $\gamma + p \rightarrow K^0 + \Sigma(+)$ photoproduction reaction is investigated in the energy region from threshold to $E_\gamma = 2250$ MeV. The differential cross section exhibits increasing forward-peaking with energy, but only up to the K^* threshold. Beyond, it suddenly returns to a flat distribution with the forward cross section dropping by a factor of four. In the total cross section a pronounced structure is observed between the $K^*\Lambda$ and $K^*\Sigma$ thresholds. (C) 2012 Published by Elsevier B.V.
