Title Georeferenced biological databases - A tool for understanding mountain biodiversity

Journal Mountain Research and Development

Volume 27

Number 1

Pages 80-81

Data-bases on biodiversity linked to geophysical data (e.g. altitude, temperature) are valuable tools for the analysis of biodiversity patterns. In cooperation with the Global Biodiversity Information Facility (GBIF), the Global Mountain Biodiversity Assessment (GMBA) encourages a global effort to mine georeferenced archive databases on mountain organisms. The EUROMONT initiative is one example of such a data analysis. It assesses climate threat to alpine plant diversity and focuses on European mountain ranges.
