Title Adding the missing link back into mate choice research

Journal Behavioral and Brain Sciences

Volume 28

Number 2

Pages / Article-Number 289-+

Evolutionary psychologists should go beyond research on individual differences in attitudes and focus more on detailed models of psychological mechanisms. We argue for complementing attitude research with agent-based computational modeling of mate choice. Agent-based models require detailed specification of individual choice mechanisms that can be evaluated in terms of both their psychological plausibility and the population-level outcomes they produce.
