**Title** An Artificial Imine Reductase based on the Ribonuclease S Scaffold

**Journal** ChemCatChem

**Volume** 6

**Number** 3

**Pages / Article-Number** 736-740

**Keywords** asymmetric catalysis, half-sandwich complexes, metalloenzymes, reduction, transfer hydrogenation

Dative anchoring of a piano-stool complex within ribonucleaseS resulted in an artificial imine reductase. The catalytic performance was modulated upon variation of the coordinating amino acid residues in the S-peptide. Binding of Cp<sup>\*</sup>Ir (Cp<sup>\*</sup>=C5Me<sub>5</sub>) to the native active site resulted in good conversions and moderate enantiomeric excess values for the synthesis of salsolidine.
