Organisation / Research unit

Ethik / Bio- und Medizinethik (Elger)

Department

Project start 01.05.2015

Probable end 01.05.2018

Status Completed

Favoring patient self-determination is a central goal of palliative care and has motivated recent changes in federal adult protection law. Therefore, quality of palliative care must be measured also in terms of the extent to which patient self-determination is respected and improved.

The benefits of early intervention in palliative care being proven, mobile specialized palliative care teams in acute care hospitals are an important but yet under-researched asset in Switzerland.

With the objective to measure quality of palliative care provision, the present study will evaluate and compare patient self-determination related outcomes and procedures in 3 different settings: the recently started palliative care consultant service at the University Hospital of Basel which provides decentralized consultations for inpatients (i) as well as the corresponding mobile consultation at the University Hospitals of Geneva (main acute care site Cluse-Roseiraie) (ii), and palliative care provision at the specialized palliative ward (iii) of the Inselspital, Bern.
