Title Aspects of the derivative coupling model in four dimensions

Journal European Physical Journal C. Particles and Fields

Volume 74

Number 1

Pages / Article-Number 2689

A concise discussion of a 3+1 dimensional derivative coupling model, in which a massive Dirac field couples to the four-gradient of a massless scalar field, is given in order to elucidate the role of different concepts in quantum field theory like the regularization of quantum fields as operator-valued distributions, correlation distributions, locality, causality, and field operator gauge transformations.
