1,n-Metal shift is an elegant alternative approach enabling the functionalization of remote C H bonds from simple precursors. In this work, we report a novel and simple Pd<sup>0</sup>-catalyzed domino reaction involving 1,4-palladium shift and C(sp<sup>3</sup>)-H activation and leading to (fused) five-membered rings. This method allowed access to a broad range of valuable arylidene gamma-lactams and indanones and was applied to the formal synthesis of (-)-pyrrolam.
