Cobalamin deficiency in ambulatory individuals: awareness and preferences for substitution

Project funded by own resources

Project title Cobalamin deficiency in ambulatory individuals: awareness and preferences for substitution

Principal Investigator(s) Arnet, Isabelle ;

Co-Investigator(s) Rothen, Jean-Pierre ; Hersberger, Kurt ; Walter, Philipp ; Tsakiris, Dimitrios ;

Project Members Morina, Dardan ; Infantini, Laura ;

Organisation / Research unit

Departement Pharmazeutische Wissenschaften / Pharmaceutical Care (Hersberger)

Project start 01.06.2019

Probable end 31.12.2021

Status Completed

Deficiency of cobalamin (vitamin B12) is determined in laboratory with various strategies that measure different biomarkers such as vitamin B12, holotranscobalamin or both simultaneously. However, patient history and clinical signs should also be considered when posing the diagnosis. We aim at exploring which laboratory strategy is cost-efficient in the clinical setting. We will analyse retrospectively laboratory data.

We also aim at investigating the awareness of cobalamin deficiency in the population at risk (such as older adults, vegetarians, vegans). We will determine patient preferences for substitution treatment that guarantees best medication adherence. We will conduct focus group discussions.

Keywords cobalamin, deficiency, risk factors, substitution, patient preferences

Financed by

University funds
